

Automated Journalist Application

From Social Networks to News Articles, how AI can aid journalists.

Workflow

User Experience

Analyze the following text and provide at least {num_topics} most suitable topics, along with their percentages and the relevant 15 keywords.

Text: {preprocessed_doc}
Format the output as a JSON object:
{
 "topics": [
 {
 "name": "Topic1",
 "percentage": 25.0,
 "keywords": ["keyword1", "keyword2", ...]
 }, ...]
}

"formal": "Use a professional and objective tone, suitable for a reputable news outlet.",
"gen_z": "Use a Gen Z tone, be witty, include pop culture references, and keep it conversational.",
"persuasive": "Write persuasively, using emotional and motivational language.",
"satirical": "Write in a satirical tone, with humor and irony to critique the subject.",
"poetic": "Write in a poetic style, with metaphorical and rhythmic language.",

You are a professional journalist writing for a major news outlet. Your goal is to craft a compelling and detailed news article.
Topic: {topic}
Summary: {summary}
Key Points and Keywords: {keywords}
Style: {tone_instructions}
Requirements:
1. Write a long, engaging news article.
2. Include an attention-grabbing headline at the beginning.
3. Expand upon the provided summary using the listed keywords. Use them naturally throughout the article.
4. Include historical context, background, or analysis where relevant.
5. Use the specified style and tone throughout the article.
Instructions:
Start your response with the headline, followed by the full article.

Future Scopes

- Currently, our model generates news articles based on social media inputs. In the future, we aim to integrate fact-checking mechanisms by connecting to trusted news sources such as BBC or CNN through their APIs. This will enable our system to validate the truthfulness of generated content, ensuring greater accuracy and credibility.
- To enhance the quality of article generation, we plan to fine-tune the model for better performance. Additionally, to optimize resource usage and reduce GPU requirements, methods like QLoRA are recommended, enabling efficient and cost-effective model adaptation.
